The International Institute for Counterterrorism (ICT) is a non-profit, non-governmental organization founded in 1996 within the leading private academic institution in Israel; the Interdisciplinary Center (IDC), Herzliya.

As one of the most veteran centers of excellence globally focused on terrorism and counterterrorism, as well as societal and critical infrastructure resiliency and tangent and related fields, the ICT has crafted a unique interdisciplinary doctrine to understand terrorism, counterterrorism, CVE and HLS that combines academic excellence together with decades of practical experience in the field. ICT researchers and fellows include leading academic experts, counter-terrorism experts, former heads of Israel’s various security services (intelligence, police, military, National Security Council, Prison Service and more).

ICT has led and partook in multiple international projects including, but not limited to research (including the EU’s Horizon 2020 program and various NATO programs), threat assessments, simulations and “red team” activity, advisory to decision makers, as well as other similar activities). ICT has led education and training (academic and practical), professional workshops and conferences (among which is the leading world event in the field of counterterrorism – ICT’s World Summit on Counterterrorism). These projects dealt, among others, with cyberterrorism, radicalization and online incitement, terrorism finance, technology – AI and terrorism, aerial and marine terrorism, border security, critical infrastructure protection, crisis management of security events, terrorist attacks, and large scale natural disasters (including their psychological and medical ramifications).
